Python Program to Find Minimum and Maximum of Two Numbers

Aim

To write a Python program that accepts two numbers from the user and displays the smaller (minimum) and larger (maximum) values.

Algorithm

1. Start the program.
2. Read the first number and store it in **a**.
3. Read the second number and store it in **b**.
4. Compare the two numbers using **if** and **else** statements.
5. Display the minimum and maximum values.
6. Stop the program.

Python Code

```
# Program to find the minimum and maximum of two numbers

a = int(input("Enter the first number: "))
b = int(input("Enter the second number: "))

if a < b:
    minimum = a
    maximum = b
elif a > b:
    minimum = b
    maximum = a
else:
    minimum = maximum = a

print("Minimum number:", minimum)
print("Maximum number:", maximum)
```

Sample Output

```
Enter the first number: 25
Enter the second number: 10
Minimum number: 10
Maximum number: 25
```

Explanation

• **input()** reads a value entered by the user.

• **int()** converts the input into an integer.

• **if** and **elif** compare the two numbers.

• **minimum** stores the smaller number, while **maximum** stores the larger number.

• If both numbers are equal, both minimum and maximum are set to that same number.

Result

The program successfully finds and displays the minimum and maximum of two numbers.
